

The Battle of Neighborhoods

November 4, 2019

1 The Battle of Neighborhoods - Week 2

1.0.1 Introduction

The City of New York, usually called either New York City (NYC) or simply New York (NY), is the most populous city in the United States. With an estimated 2018 population of 8,398,748 distributed over a land area of about 302.6 square miles (784 km²), New York is also the most densely populated major city in the United States. Located at the southern tip of the state of New York, the city is the center of the New York metropolitan area, the largest metropolitan area in the world by urban landmass and one of the world's most populous megacities, with an estimated 19,979,477 people in its 2018 Metropolitan Statistical Area and 22,679,948 residents in its Combined Statistical Area. A global power city, New York City has been described as the cultural, financial, and media capital of the world, and exerts a significant impact upon commerce, entertainment, research, technology, education, politics, tourism, art, fashion, and sports. 62.85% of New York City residents were born in the United States, with 48.29% having been born in New York. 16.67% of residents are not US citizens. Of those not born in the United States, the largest percentage are from Latin America

Throughout its history, New York City has been a major point of entry for immigrants; the term "melting pot" was coined to describe densely populated immigrant neighbourhoods on the Lower East Side. As many as 800 languages are spoken in New York, making it the most linguistically diverse city in the world. English remains the most widely spoken language, although there are areas in the outer boroughs in which up to 25% of people speak English as an alternate language, and/or have limited or no English language fluency. English is least spoken in neighbourhoods such as Flushing, Sunset Park, and Corona.

With its diverse culture, comes diverse food items. There are many restaurants in New York City, each belonging to different categories like Chinese, Mexican, and French etc.

1.1 Problem Statement

One of my client is looking to setup a mexican restaurant in NYC. He would like to narrow down the neighbourhood of NYC through a data driven approach along with his interaction with industry experts, vendors and other stake holders. As an analyst, i would like to explore the best mexican restaurants in NYC. So as part of this project, we will list and visualize all major parts of New York City that has great Mexican restaurants along with narrowing down on a neighbourhood for potential opportunity for an mexican restaurant.

1.1.1 Data

For this project we need the following data:

New York City data that contains list Boroughs, Neighbourhoods along with their latitude and longitude.

```
<li>Data source : https://cocl.us/new\_york\_dataset
<li> Description : This data set contains the required information. And we will use this data
</ul>
```

Mexican restaurants in each neighbourhood of New York City.

```
<li>Data source : Foursquare API
<li> Description : By using this api we will get all the venues in each neighbourhood. We can
</ul>
```

GeoSpace data

```
<li>Data source : https://data.cityofnewyork.us/City-Government/Borough-Boundaries/tqmj-j88
<li> Description : By using this geo space data we will get the New York Borough boundaries
```

1.1.2 Approach or Methodology

- Collect the new york city data from https://cocl.us/new_york_dataset
- Using FourSquare API we will find all venues for each neighborhood.
- Filter out all venues that are Mexican Restaurants.
- Find rating , tips and like count for each Mexican Restaurants using FourSquare API.
- Using rating for each restaurant , we will sort that data.
- Visualize the Ranking of neighborhoods using folium library(python)

1.1.3 Questions that can be asked using the above mentioned datasets

- What is best location in New York City for Mexican Cuisine ?
- Which areas have potential Mexican Restaurant Market ?
- Which all areas lack Mexican Restaurants ?
- Which is the best place to stay if I prefer Mexican Cuisine ?

1.1.4 Analysis

We will import the required libraries for python.

- pandas and numpy for handling data.
- request module for using FourSquare API.
- geopy to get co-ordinates of City of New York.
- folium to visualize the results on a map

Now we define a function to get the geocodes i.e latitude and longitude of a given location using geopy.

```
[28]: import pandas as pd
import numpy as np
pd.set_option('display.max_columns', None)
```

```

pd.set_option('display.max_rows', None)
import requests
!conda install -c conda-forge geopy --yes
#!pip install geocoder
import geocoder
import folium # map rendering library
from geopy.geocoders import Nominatim # convert an address into latitude and
↳ longitude values
# Matplotlib and associated plotting modules
import matplotlib.pyplot as plt
import matplotlib.cm as cm
import matplotlib.colors as colors
%matplotlib inline

```

```

[29]: def geo_location(address):
    # get geo location of address
    geolocator = Nominatim(user_agent="ny_explorer")
    location = geolocator.geocode(address)
    latitude = location.latitude
    longitude = location.longitude
    return latitude, longitude

```

We define a function to interact with FourSquare API and get top 100 venues within a radius of 1000 metres for a given latitude and longitude. Below function will return us the venue id , venue name and category.

```

[30]: def get_venues(lat, lng):

    #set variables
    radius=1000
    LIMIT=100
    CLIENT_ID = 'SCOF4RRIQKE05LT3TFCDFLYOE1JCCKB3NWDGTWQPDPCMSDTF' # your
↳ Foursquare ID
    CLIENT_SECRET = 'R2BNL2LV0EVF5G03GIFASMKS0ENZANFITVKVDSQOEINAIS2C' # your
↳ Foursquare Secret
    VERSION = '20180605' # Foursquare API version

    #url to fetch data from foursquare api
    url = 'https://api.foursquare.com/v2/venues/explore?
↳ &client_id={}&client_secret={}&v={}&ll={},{}&radius={}&limit={}'.format(
        CLIENT_ID,
        CLIENT_SECRET,
        VERSION,
        lat,
        lng,
        radius,
        LIMIT)

```

```

# get all the data
results = requests.get(url).json()
venue_data=results["response"]["groups"][0]['items']
venue_details=[]
for row in venue_data:
    try:
        venue_id=row['venue']['id']
        venue_name=row['venue']['name']
        venue_category=row['venue']['categories'][0]['name']
        venue_details.append([venue_id,venue_name,venue_category])
    except KeyError:
        pass

column_names=['ID','Name','Category']
df = pd.DataFrame(venue_details,columns=column_names)
return df

```

Now we will define a function to get venue details like like count , rating , tip counts for a given venue id. This will be used for ranking.

```

[31]: def get_venue_details(venue_id):

    CLIENT_ID = 'SCOF4RRIQKE05LT3TFCDFLYOE1JCCKB3NWDGTWQPDPCMSDTF' # your_
↳Foursquare ID
    CLIENT_SECRET = 'R2BNL2LV0EVF5G03GIFASMKSOENZANFITVKVDSQOEINAIS2C' # your_
↳Foursquare Secret
    VERSION = '20180605' # Foursquare API version

    #url to fetch data from foursquare api
    url = 'https://api.foursquare.com/v2/venues/{}?
↳&client_id={}&client_secret={}&v={}'.format(
        venue_id,
        CLIENT_ID,
        CLIENT_SECRET,
        VERSION)

    # get all the data
    results = requests.get(url).json()
    venue_data=results['response']['venue']
    venue_details=[]
    try:
        venue_id=venue_data['id']
        venue_name=venue_data['name']
        venue_likes=venue_data['likes']['count']
        venue_rating=venue_data['rating']

```

```

        venue_tips=venue_data['tips']['count']
        venue_details.
    ↪append([venue_id,venue_name,venue_likes,venue_rating,venue_tips])
    except KeyError:
        pass

    column_names=['ID', 'Name', 'Likes', 'Rating', 'Tips']
    df = pd.DataFrame(venue_details,columns=column_names)
    return df

```

Now we define a function to get the new york city data such as Boroughs, Neighborhoods along with their latitude and longitude.

```

[33]: def get_new_york_data():
    url='https://cocl.us/new_york_dataset'
    resp=requests.get(url).json()
    # all data is present in features label
    features=resp['features']

    # define the dataframe columns
    column_names = ['Borough', 'Neighborhood', 'Latitude', 'Longitude']
    # instantiate the dataframe
    new_york_data = pd.DataFrame(columns=column_names)

    for data in features:
        borough = data['properties']['borough']
        neighborhood_name = data['properties']['name']

        neighborhood_latlon = data['geometry']['coordinates']
        neighborhood_lat = neighborhood_latlon[1]
        neighborhood_lon = neighborhood_latlon[0]

        new_york_data = new_york_data.append({'Borough': borough,
                                              'Neighborhood': neighborhood_name,
                                              'Latitude': neighborhood_lat,
                                              'Longitude': neighborhood_lon},
                                              ignore_index=True)

    return new_york_data

```

We will call the above function to get the new york city data.

```

[25]: # get new york data
new_york_data=get_new_york_data()

```

```

[26]: new_york_data.head()

```

```
[26]: Borough Neighborhood Latitude Longitude
0 Bronx Wakefield 40.894705 -73.847201
1 Bronx Co-op City 40.874294 -73.829939
2 Bronx Eastchester 40.887556 -73.827806
3 Bronx Fieldston 40.895437 -73.905643
4 Bronx Riverdale 40.890834 -73.912585
```

```
[27]: new_york_data.shape
```

```
[27]: (306, 4)
```

So there are total of 306 different Neighborhoods in New York

```
[28]: import matplotlib.pyplot as plt
plt.figure(figsize=(9,5), dpi = 100)
# title
plt.title('Number of Neighborhood for each Borough in New York City')
#On x-axis
plt.xlabel('Borough', fontsize = 15)
#On y-axis
plt.ylabel('No.of Neighborhood', fontsize=15)
#giving a bar plot
new_york_data.groupby('Borough')['Neighborhood'].count().plot(kind='bar')
#legend
plt.legend()
#displays the plot
plt.show()
```

We see that Queens has highest number of neighborhoods

Now we will collect Mexican restaurants for each Neighborhood

```
[36]: # prepare neighborhood list that contains Mexican restaurants
column_names=['Borough', 'Neighborhood', 'ID', 'Name']
mexican_rest_ny=pd.DataFrame(columns=column_names)
count=1
for row in new_york_data.values.tolist():
    Borough, Neighborhood, Latitude, Longitude=row
    venues = get_venues(Latitude,Longitude)
    mexican_restaurants=venues[venues['Category']=='Mexican Restaurant']
    print('(',count,'/',len(new_york_data),')','Mexican Restaurants in_
    ↪'+Neighborhood+', '+Borough+':'+str(len(mexican_restaurants)))
    for restaurant_detail in mexican_restaurants.values.tolist():
        id, name , category=restaurant_detail
        mexican_rest_ny = mexican_rest_ny.append({'Borough': Borough,
                                                    'Neighborhood': Neighborhood,
                                                    'ID': id,
                                                    'Name' : name
                                                    }, ignore_index=True)

    count+=1
```

(1 / 306) Mexican Resturants in Wakefield, Bronx:0

```

Now that we have got all the mexican resturants in new york city , we will analyze it

```
[37]: mexican_rest_ny.head()
```

```
[37]:
```

	Borough	Neighborhood	ID	Name
0	Bronx	Co-op City	5c47a4b21953f3002c558218	Chipotle Mexican Grill
1	Bronx	Co-op City	58582b156431e554e165d909	Moe's Southwest Grill
2	Bronx	Fieldston	523f6e14498ef6fdefc0d690	Burrito Shop
3	Bronx	Fieldston	4b78ba71f964a5209fdf2ee3	Santa Fe Grill & Bar
4	Bronx	Fieldston	5ce9664e3731ee002baae6ed	Estrellita Poblana

```
[39]: mexican_rest_ny.shape
```

```
[39]: (328, 4)
```

We got 328 Mexican Resturants across New York City

```
[41]: plt.figure(figsize=(9,5), dpi = 100)
# title
plt.title('Number of Mexican Resturants for each Borough in New York City')
#On x-axis
plt.xlabel('Borough', fontsize = 15)
#On y-axis
plt.ylabel('No.of Mexican Resturants', fontsize=15)
#giving a bar plot
mexican_rest_ny.groupby('Borough')['ID'].count().plot(kind='bar')
#legend
plt.legend()
#displays the plot
```

```
plt.show()
```

We see that Brooklyn has the largest number of mexican resturants

```
[42]: plt.figure(figsize=(9,5), dpi = 100)
# title
plt.title('Number of Mexican Restaurants for each Neighborhood in New York City')
#On x-axis
plt.xlabel('Neighborhood', fontsize = 15)
#On y-axis
plt.ylabel('No. of Mexican Restaurants', fontsize=15)
#giving a bar plot
mexican_rest_ny.groupby('Neighborhood')['ID'].count().nlargest(5).
    plot(kind='bar')
#legend
plt.legend()
#displays the plot
plt.show()
```

```
[44]: mexican_rest_ny.groupby('Neighborhood')['ID'].count().nlargest(5)
```

```
[44]: Neighborhood
Ditmas Park      8
Elmhurst         8
Jackson Heights  8
Sunset Park      8
Bushwick         7
Name: ID, dtype: int64
```

```
[46]: mexican_rest_ny[mexican_rest_ny['Neighborhood']=='Ditmas Park']
```

```
[46]:
```

	Borough	Neighborhood	ID	Name
261	Brooklyn	Ditmas Park	596938a0a22db76efcd439a6	Los Tres Chiflados
262	Brooklyn	Ditmas Park	4ad123f7f964a52003dd20e3	Cinco de Mayo
263	Brooklyn	Ditmas Park	52b1cc13498e28159d0fadb8	El Paso Mexican Grill
264	Brooklyn	Ditmas Park	5491cc2b498ea98016a548b2	Mallenche Mexican Grill
265	Brooklyn	Ditmas Park	4b79ee38f964a520f31a2fe3	El Ranchito Poblano
266	Brooklyn	Ditmas Park	57b3b186498ef68837df6be3	Mexico Diner
267	Brooklyn	Ditmas Park	4b5111c2f964a520b44027e3	Los Mariachis
268	Brooklyn	Ditmas Park	4b92e166f964a520062434e3	Don Burrito

So Ditmas Park in Brooklyn has the highest number of Mexican Restaurants with a total count of 8.

Now we will get the ranking of each restaurant for further analysis.

```
[47]: # prepare neighborhood list that contains Mexican restaurants

--> 10         venue_details=get_venue_details(ID)
      11         print(venue_details)
      12         id,name,likes,rating,tips=venue_details.values.tolist()[0]

```

```

<ipython-input-32-916faee5952a> in get_venue_details(venue_id)
     14     # get all the data
     15     results = requests.get(url).json()
--> 16     venue_data=results['response']['venue']
     17     venue_details=[]
     18     try:

```

```

KeyError: 'venue'

```

```
[48]: mexican_rest_stats_ny.head()
```

```
[48]:
```

	Borough	Neighborhood	ID	Name \
0	Bronx	Co-op City	5c47a4b21953f3002c558218	Chipotle Mexican Grill
1	Bronx	Co-op City	58582b156431e554e165d909	Moe's Southwest Grill
2	Bronx	Fieldston	523f6e14498ef6fdefc0d690	Burrito Shop
3	Bronx	Fieldston	4b78ba71f964a5209fdf2ee3	Santa Fe Grill & Bar
4	Bronx	Fieldston	0	0

	Likes	Rating	Tips
0	0	7.5	0
1	1	6.6	0
2	10	6.9	4
3	11	6.3	17
4	0	0.0	0

```
[49]: mexican_rest_stats_ny.shape
```

```
[49]: (50, 7)
```

```
[50]: mexican_rest_ny.shape
```

```
[50]: (328, 4)
```

So we got data for all resturants Now lets save this data to a csv sheet. In case we by mistake modify it. As the number of calls to get details for venue are premium call and have limit of 500 per day, we will refer to saved data sheet csv if required

```
[51]: mexican_rest_stats_ny.to_csv('mexican_rest_stats_ny.csv', index=False)
```

Lets verify the data from saved csv file

```
[52]: mexican_rest_stats_ny_csv=pd.read_csv('mexican_rest_stats_ny.csv')
```

```
[53]: mexican_rest_stats_ny_csv.shape
```

```
[53]: (50, 7)
```

```
[54]: mexican_rest_stats_ny_csv.head()
```

```
[54]:
```

	Borough	Neighborhood	ID	Name \
0	Bronx	Co-op City	5c47a4b21953f3002c558218	Chipotle Mexican Grill
1	Bronx	Co-op City	58582b156431e554e165d909	Moe's Southwest Grill
2	Bronx	Fieldston	523f6e14498ef6fdefc0d690	Burrito Shop
3	Bronx	Fieldston	4b78ba71f964a5209fdf2ee3	Santa Fe Grill & Bar
4	Bronx	Fieldston	0	0

	Likes	Rating	Tips
0	0	7.5	0
1	1	6.6	0

2	10	6.9	4
3	11	6.3	17
4	0	0.0	0

```
[55]: mexican_rest_stats_ny.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 50 entries, 0 to 49
Data columns (total 7 columns):
Borough          50 non-null object
Neighborhood      50 non-null object
ID                50 non-null object
Name              50 non-null object
Likes             50 non-null object
Rating            50 non-null float64
Tips              50 non-null object
dtypes: float64(1), object(6)
memory usage: 2.8+ KB
```

We see that values like Likes, Tips are string values. We would need to convert them into float for further analysis

```
[56]: mexican_rest_stats_ny['Likes']=mexican_rest_stats_ny['Likes'].astype('float64')
```

```
[57]: mexican_rest_stats_ny['Tips']=mexican_rest_stats_ny['Tips'].astype('float64')
```

```
[58]: mexican_rest_stats_ny.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 50 entries, 0 to 49
Data columns (total 7 columns):
Borough          50 non-null object
Neighborhood      50 non-null object
ID                50 non-null object
Name              50 non-null object
Likes             50 non-null float64

Tips              50 non-null float64
dtypes: float64(3), object(4)
memory usage: 2.8+ KB
```

Now the data types look correct

```
[59]: # Restaurant with maximum Likes
mexican_rest_stats_ny.iloc[mexican_rest_stats_ny['Likes'].idxmax()]
```

```
[59]: Borough          Bronx
      Neighborhood      Parkchester
      ID                4b4929d2f964a520656826e3
```

```
Name          Taqueria Tlaxcali
Likes          130
Rating         9.1
Tips           72
Name: 43, dtype: object
```

```
[60]: # Resturant with maximum Rating
mexican_rest_stats_ny.iloc[mexican_rest_stats_ny['Rating'].idxmax()]
```

```
[60]: Borough          Bronx
Neighborhood      Parkchester
ID              4b4929d2f964a520656826e3
Name          Taqueria Tlaxcali
Likes          130
Rating         9.1
Tips           72
Name: 43, dtype: object
```

```
[83]: # Resturant with maximum Tips
mexican_rest_stats_ny.iloc[mexican_rest_stats_ny['Tips'].idxmax()]
```

```
[83]: Borough          Bronx
Neighborhood      Parkchester
ID              4b4929d2f964a520656826e3
Name          Taqueria Tlaxcali
Likes          130
Rating         9.1
Tips           72
Name: 43, dtype: object
```

Now lets visualize neighborhood with maximum average rating of resturants

```
[84]: ny_neighborhood_stats=mexican_rest_stats_ny.
      ↳groupby('Neighborhood',as_index=False).mean()[['Neighborhood','Rating']]
ny_neighborhood_stats.columns=['Neighborhood','Average Rating']
```

```
[92]: ny_neighborhood_stats.sort_values(['Average Rating'],ascending=False)
```

```
[92]:
```

	Neighborhood	Average Rating
20	Westchester Square	8.500000
12	Morris Park	8.500000
16	Parkchester	8.400000
14	Mott Haven	8.400000
7	High Bridge	8.000000
18	Riverdale	7.750000
13	Morrisania	7.750000
8	Kingsbridge	7.733333

11	Melrose	7.716667
2	Belmont	7.650000
0	Baychester	7.050000
3	Co-op City	7.050000
9	Longwood	6.950000
6	Fordham	6.700000
10	Marble Hill	6.100000
15	Norwood	4.933333
1	Bedford Park	4.800000
5	Fieldston	4.400000
4	Country Club	3.900000

Above are the top neighborhoods with top average rating of mexican resturants

```
[90]: ny_borough_stats=mexican_rest_stats_ny.groupby('Borough',as_index=False).
      ↪mean()[['Borough','Rating']]
ny_borough_stats.columns=['Borough','Average Rating']
```

```
[91]: ny_borough_stats.sort_values(['Average Rating'],ascending=False).head()
```

```
[91]:   Borough  Average Rating
0    Bronx      6.630435
1  Manhattan      6.100000
```

Similarly these are the average rating of mexican Resturants for each Borough

Lets visualize it

```
[76]: plt.figure(figsize=(9,5), dpi = 100)
      # title
      plt.title('Average rating of Mexican Resturants for each Borough')
      #On x-axis
      plt.xlabel('Borough', fontsize = 15)
      #On y-axis
      plt.ylabel('Average Rating', fontsize=15)
      #giving a bar plot
      mexican_rest_stats_ny.groupby('Borough').mean()['Rating'].plot(kind='bar')
      #legend
      plt.legend()
      #displays the plot
      plt.show()
```

We will consider all the neighborhoods with average rating greater or equal 9.0 to visualize on map

```
[89]: ny_neighborhood_stats=ny_neighborhood_stats[ny_neighborhood_stats['Average_Rating']>=1.0]
```

```
[80]: ny_neighborhood_stats
```

```
[80]: Empty DataFrame
Columns: [Neighborhood, Average Rating]
Index: []
```

We will join this dataset to original new york data to get longitude and latitude

```
[93]: ny_neighborhood_stats=pd.merge(ny_neighborhood_stats,new_york_data,
on='Neighborhood')
```

```
[94]: ny_neighborhood_stats=ny_neighborhood_stats[['Borough','Neighborhood','Latitude','Longitude','Average_Rating']]
```

```
[95]: ny_neighborhood_stats
```

```
[95]:
```

	Borough	Neighborhood	Latitude	Longitude	Average Rating
0	Bronx	Baychester	40.866858	-73.835798	7.050000

1	Bronx	Bedford Park	40.870185	-73.885512	4.800000
2	Bronx	Belmont	40.857277	-73.888452	7.650000
3	Bronx	Co-op City	40.874294	-73.829939	7.050000
4	Bronx	Country Club	40.844246	-73.824099	3.900000
5	Bronx	Fieldston	40.895437	-73.905643	4.400000
6	Bronx	Fordham	40.860997	-73.896427	6.700000
7	Bronx	High Bridge	40.836623	-73.926102	8.000000
8	Bronx	Kingsbridge	40.881687	-73.902818	7.733333
9	Bronx	Longwood	40.815099	-73.895788	6.950000
10	Manhattan	Marble Hill	40.876551	-73.910660	6.100000
11	Bronx	Melrose	40.819754	-73.909422	7.716667
12	Bronx	Morris Park	40.847549	-73.850402	8.500000
13	Bronx	Morrisania	40.823592	-73.901506	7.750000
14	Bronx	Mott Haven	40.806239	-73.916100	8.400000
15	Bronx	Norwood	40.877224	-73.879391	4.933333
16	Bronx	Parkchester	40.837938	-73.856003	8.400000
17	Bronx	Riverdale	40.890834	-73.912585	7.750000
18	Bronx	Westchester Square	40.840619	-73.842194	8.500000

Now we will show this data on a map

```
[34]: # create map and display it
```

```
ny_map = folium.Map(location=geo_location('New York'), zoom_start=12)
```

```
[33]: ny_map = folium.Map(location=geo_location('New York'), zoom_start=12)
```

```
[110]: # instantiate a feature group for the incidents in the dataframe
```

```
incidents = folium.map.FeatureGroup()
```

```
# loop through the 100 crimes and add each to the incidents feature group
for lat, lng, in ny_neighborhood_stats[['Latitude', 'Longitude']].values:
    incidents.add_child(
        folium.CircleMarker(
            [lat, lng],
            radius=10, # define how big you want the circle markers to be
            color='yellow',
            fill=True,
            fill_color='blue',
            fill_opacity=0.6
        )
    )
```

Lets add a new field to dataframe for labeling purpose

```
[111]: ny_neighborhood_stats['Label']=ny_neighborhood_stats['Neighborhood']+','+
↳'+ny_neighborhood_stats['Borough']+ '('+ny_neighborhood_stats['Average_
↳Rating'].map(str)+')'
```

```
[112]: # add pop-up text to each marker on the map
for lat, lng, label in ny_neighborhood_stats[['Latitude', 'Longitude', 'Label']].
    ↪values:
    folium.Marker([lat, lng], popup=label).add_to(ny_map)
# add incidents to map
ny_map.add_child(incidents)
```

```
[112]: <folium.folium.Map at 0x7f4210359b38>
```

Now that we have visualized the Neighborhoods. Lets Visualize Boroughs based on average Rating

```
[ ]: ny_map = folium.Map(location=geo_location('New York'), zoom_start=12)
ny_geo = 'Borough Boundaries.geojson'

ny_map.choropleth(
    geo_data=ny_geo,
    data=ny_borough_stats,
    columns=['Borough', 'Average Rating'],
    key_on='feature.properties.boro_name',
    fill_color='YlOrRd',
    fill_opacity=0.7,
    line_opacity=0.2,
    legend_name='Average Rating'
)

# display map
# as this is huge map data , we will save it to a file
```

1.1.5 Results

- Westchester Square(Bronx), Morris Park(Bronx), Marble Hill(Manhattan) are some of the best neighborhoods for Mexican cuisine.
- Manhattan have potential Mexican Resturant Market
- Staten Island ranks last in average rating of Mexican Resturants.
- Bronx is the best place to stay if you prefer Mexican Cuisine.
- Ditmas Park, Elmhurst, Jackson Heights neighbourhoods has 8 Mexican restaurants
- Taqueria Tlaxcali in Bronx is highly liked & rated restaurant
- Taqueria Tlaxcali in Bronx is also highly tipped restaurant

1.1.6 Discussions

- It is recommended that Manhattan would be the best choice to open an mexican restaurant preferably in a truck instead of spending high rentals in Manhattan.
- The ranking is purely on basis of rating of resturants
- The accuracy of data depends purely depends on the data provided by FourSquare
- Scope of the study is very limited due to various demographics factor
